WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

WEEK ENDING 31 DECEMBER 1943

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3, the admission rate from colds, influenza, etc., declined for the third consecutive week and during the week ending 31 December 1943 was reported at 408 per thousand per year for the United States as a whole. This rate was 35 percent below the peak rate registered three weeks earlier and 13 percent below the rate reported for the week ending 1 January 1943.

Morbidity from all forms of pneumonia continued low as in recent weeks; the admission rate reported for the week ending 31 December 1943 was more than 30 percent below that for the week ending 1 January 1943.

The admission rate from all causes and from all diseases combined for the week ending 31 December 1943 did not decline nearly as much as did morbidity from colds, influenza, etc.. The all causes rate at nearly 860 per thousand per year and the corresponding all diseases rate of just under 800 per thousand per year were both about 5 percent lower than for the week ending 1 January 1943.

The admission rate from injury for the week ending 31 December continued at 61 per thousand per year which was not only the lowest point reported in 1943 but in all likelihood the lowest rate ever reported.

The mean number of non-effectives (which at the peak of the influenza epidemic rose to 44 per thousand) had by the end of the last week of 1943 declined to 38 per thousand or below the non-effective rates prevailing during November. This low non-effective rate reflects to some extent the common practice at Xmas-time of discharging as many patients as possible from hospitals for the Christmas holidays.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

Every Service Command reported lower morbidity from colds, influenza, etc. for the week ending 31 December. The only Service Command to report morbidity from these causes in excess of 500 per thousand per year was the Eighth, where (as also in the Fourth and Ninth Service Commands) the influenza outbreak manifested itself later and did not attain abnormal proportions. The lowest rates of morbidity from colds, influenza, etc. were registered in the Ninth, First, and Sixth Service Commands.

Because of its high morbidity from colds, influenza, etc. the Eighth Service Command was the only one to report morbidity from disease in excess of 900 per thousand per year. In part, because of its relatively low morbidity from colds, influenza, etc. the First Service Command reported the lowest morbidity from disease, only 622 per thousand.

A number of Service Commands, notably the Fifth and Seventh (especially Camp Savage, Minn.), reported markedly higher rates of diarrhea and dysentery.

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity increased slightly during the week to approximately 357,000 on 31 December 1943. The number of beds occupied and the number of "available vacant" beds also showed relatively little change being reported at nearly 171,000 and nearly 116,000, respectively. As previously explained, the very low number of beds occupied and the very high number of "available vacant" beds reflect not only the waning of the influenza epidemic and the customary discharges from hospital at Xmas-time, but also the increased number of convalescent leaves and furloughs for the holidays. The slight increase in beds occupied for the week ending 31 December may to some extent be due to the termination of such leaves and furloughs. On 31 December there were only 16 stations with a bed capacity of about 10,000 which had no "available vacant" beds; among them were 5 general hospitals with a bed capacity of about 8,000 beds.

On 31 December there were 2,131 cases of malaria remaining under treatment all but 25 of which had presumably been acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was reported at 15,333, while the number of tuberculosis cases totaled 937.
